

ABSTRACT

5 A system, method, and apparatus for session resumption
in a wireless data network is presented herein. A wireless
content switch is placed between the wired network and the
mobile station which maintains a session log of pending
sessions, including the mobile session, the content server,
and status of the session. Wherein the session is
interrupted, and resumed, the session log is examined for a
record associated with the resumed session. Wherein a
10 record is found for the resumed session, the wireless
content switch modifies commands to permit session
resumption at the point of interruption, in contrast with
restarting the session.
